

## International energy problems

Our life has been becoming convenient by using fossil energy. But, we depend on the fossil energy too much. We can understand that the amount of ( ) is limited to see the graph. We can not continue to mine it so long.

( ) attaches great importance to the energy problem because consumption of energy is large in the world.

More over, we found a big program by related with fossil energy. It is about ( ) which was made by burning fossil fuel. For example in Japan, quantity of ( ) which is exhausted by generation of electricity using fossil fuel occupy 60% of the whole of ( ) which is exhausted by generation of electricity.

Then, why cannot carbon dioxide be increased? It is because, global warming and sea level rising are the phenomenon that is triggered by the green house gas increase. In other words, using energy exercise many influences to environment. This program is concerned with our life directly. So,we thought "we should change our thought of energy production and usage". We made up our mind to search methods to produce energy.

"Why we have energy problem yet? If energy in the world change renewable energy, energies are in excess preferably?"

But, There was reasons that can not be solved there.

There is the ( " " ) , ( " " ) and ( " I" ) challenge.
